

Answer and Alert Modes

Dean Willis, Andrew Allen
SIP, IETF 64

Changes

- Complete rewrite of security considerations
- Minimal mandatory authorization policy included
- New header field set:

Header Field Organization

- Basic Functions
 - Answer-Mode (Manual, Auto)
 - Option: Require
 - Alert-Mode (Normal, Null)
- Privileged Equivalents
 - Priv Answer-Mode (Manual, Auto)
 - Priv-Answer-Mode (Normal, Null)

Open Issues

- ABNF errors, will fix
- Caller-Pref use possibly messed up
- Do we need explicit extensibility mechanism: “Manual” / “Auto” / token
- Would Alert-Mode be better if replaced by standardized use of alert-info?
- Will the detailed security considerations survive review?
